SPLINE KNOT
NOT TO SCALE

TOP

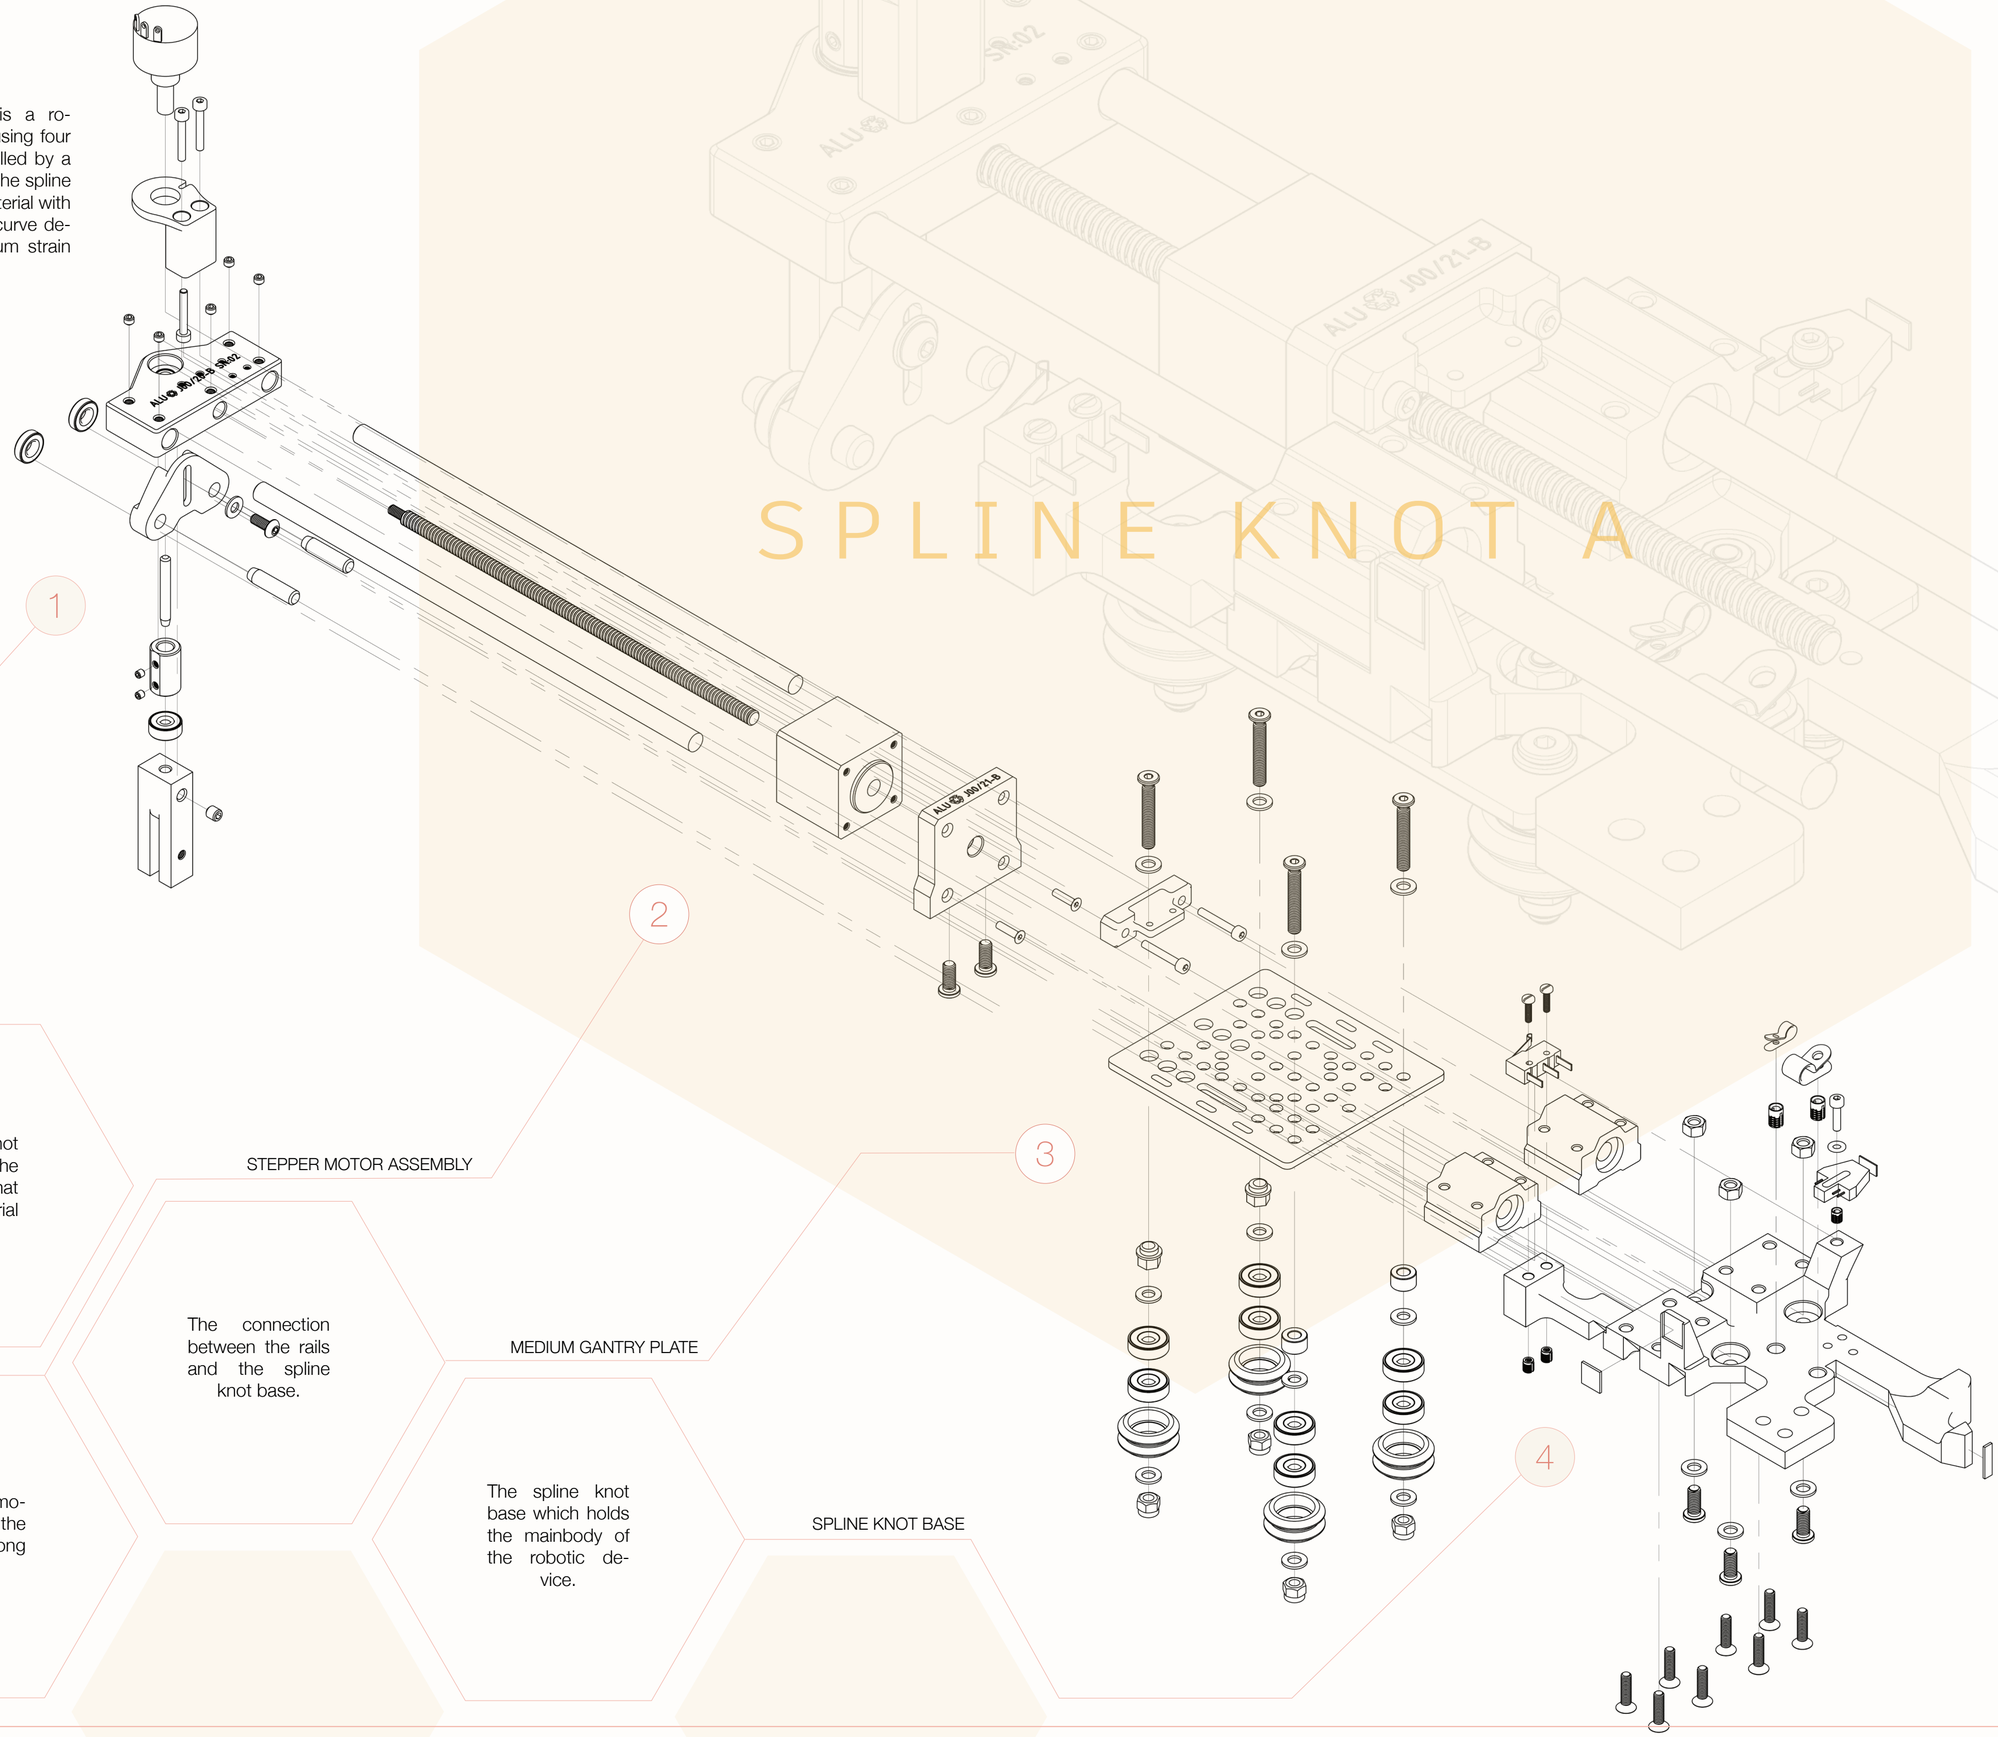

SIDE

FRONT

The SPLINEBOT is a robot that operates using four spline knots controlled by a G.A. ML program, the spline knots move the material with the result being a curve defined by its minimum strain profile.

SPLINE KNOT A

1 SPLINE KNOT HEAD

The spline knot head contains the components that rotate the material by its y-axis.

2 STEPPER MOTOR ASSEMBLY

The stepper motor translates the spline knot along the z axis.

3 MEDIUM GANTRY PLATE

The connection between the rails and the spline knot base.

4 SPLINE KNOT BASE

The spline knot base which holds the mainbody of the robotic device.
